Microbiome Balancer for Acne-Prone Skin

Embrace a skincare revolution with our microbiome balancing solution. Experience the power of exfoliation and targeted phage action working together to give you clear, healthy skin.

OUR MISSION

Our company is dedicated to revolutionizing health and well-being through innovative solutions grounded in the principles of probiotics and phage-based therapeutics. With a steadfast commitment to harnessing the power of beneficial microorganisms,

we aim to develop and deliver cutting-edge products that promote a balanced microbiome.

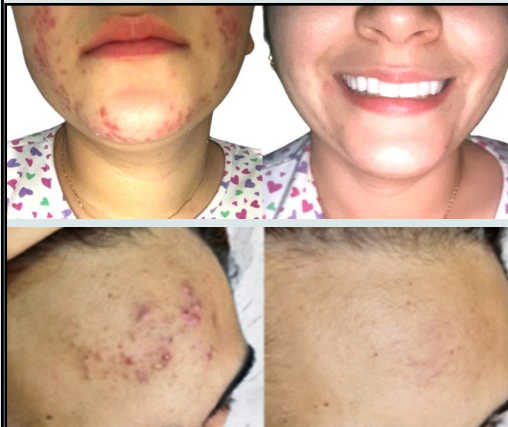

We are leveraging bacteriophages to target and combat harmful bacteria, leading to a balanced microbiome. We strive to embrace the symbiotic relationship between humans and the microorganisms that inhabit our bodies.

HOW IT WORKS

Viruses such as influenza virus have always been known as predators to human race. But, did you know that bacteria have natural predators too? They're called bacteriophages or phages for short! These tiny friendly creatures can target and destroy specific bacteria with precision without causing any harm to human cells.

Today's acne treatment products contain many different toxic chemicals that can destroy our skin's microbiota, the healthy microorganisms that protect our skin. Our scientists, after many years of innovative research, have developed a microbiome balancer that specifically targets the acne bacteria.

TWO-STEP SOLUTION

Step 1 of our solution features carefully selected exfoliating agents that serve a dual purpose – not only do they gently exfoliate the skin, promoting a smoother texture, but they also prepare the skin for the next crucial step. These exfoliating agents create a receptive environment, allowing the acne-targeting phages in Step 2 to penetrate the skin through the pores more effectively. This innovative combination ensures that our microbiome balancer works synergistically, delivering a comprehensive solution without compromising the integrity of the skin's microbiome.

Our acne specific phages in Step 2 provide a gentle yet powerful solution. Moreover, these phages are highly specific, leaving non-acne inducing bacteria unharmed, preserving the delicate balance of your skin's microbiome.
